1. OVERVIEW/PURPOSE

Haley & Aldrich, Inc. (Haley & Aldrich) has conducted an evaluation for unrestricted closure (with no deed restrictions) of shallow and deep soils at Parcel D. Parcel D is one of four parcels (Parcels A through D) of the Boeing Realty Corporation's (BRC) Former C-6 Facility (Site), at 19503 South Normandie Avenue, in Los Angeles, California (Figures 1 and 2).

In 2001, the Regional Water Quality Control Board – Los Angeles Region (LARWQCB) granted closure for shallow soils (surface to 12 feet below ground surface [bgs]) based on non-residential preliminary remediation goals (PRGs) (LARWQCB, 2001). In addition, the LARWQCB granted closure in 2003 for deep soils based on non-residential PRGs (LARWQCB, 2003). However, BRC is now seeking unrestricted closure for both shallow and deep soils at Parcel D.

This request for unrestricted closure of Parcel D includes the following:

- Brief overview of land use.
- Chronology of investigation and remediation efforts, including:
 - Compilation of shallow and deep soil assessment and post-remediation laboratory analytical results.
 - Summary of previous reports and the LARWQCB-granted shallow soil closure.
- Presentation of residential PRGs adjusted for California toxicity values (Cal-adjusted residential PRGs).
- Demonstration that shallow and deep soil residual concentrations are less than the Cal-adjusted residential PRGs.

2. BACKGROUND

2.1 Site Land Use History

The Site was first developed by the Defense Plant Corporation in 1941 as part of an aluminum production plant, and was operated by the Aluminum Corporation of America until late 1944. Prior to this use, aerial photographs indicate that the Site was farmland. From 1944 until 1948, the Site was used for warehousing by the War Assets Administration, and in 1948, was acquired by the Columbia Steel Company. In March 1952, the U.S. Navy purchased the Site and established the Douglas Aircraft Company (DAC) to manufacture aircraft and aircraft parts. DAC purchased the Site from the Navy in 1970; DAC and its successor, McDonnell Douglas Corporation (created by the 1967 merger of DAC and McDonnell Aircraft Company), continued manufacturing aircraft components until 1992. The Boeing Company took ownership of the Site in 1997, when it merged with McDonnell Douglas Corporation.

The Site has been divided into four parcels (A through D), as shown on Figure 2. Parcel D, included Buildings 59, 59A and the storage yard, and was used primarily for parts storage and/or employee parking from the 1940s until the property was vacated in 1996 (CDM 1991; Integrated 1999a). Building 59 was used for a support office for the truck weighing station. Building 59A was used for hazardous waste storage, and as an equipment maintenance garage. The storage yard was used to store various parts, including aircraft parts, steel beams and pipes, concrete parking pylons, cinder blocks, tires, and a trash compactor.

The buildings and parking and storage areas were removed as part of Site redevelopment in 2000.

2.2 Chronology of Parcel D Investigation and Remediation

Site investigation activities were conducted at Parcel D in June and July 1999, October 2000, and January 2001. A list of the various investigation documents reviewed is presented in the references section of this document. A brief overview of each assessment activity and related documentation is presented below. Figure 3 shows the soil boring locations. Appendix A includes the analytical data tables for both shallow and deep soils at Parcel D.

2.2.1 Site Investigation, June/July 1999

A *Sampling and Analysis Plan* (SAP) (Integrated 1999a) was submitted to and approved by the LARWQCB (LARWQCB 1999) prior to the commencement of the investigation activities in June and July 1999. The objectives of the Parcel D investigation were to:

- Identify and delineate potential chemical impact source areas as they relate to former operations.
- Develop sufficient data to support potential remediation.
- Evaluate the horizontal extent and vertical depth of impacted soil (if any) to facilitate a post-demolition risk assessment.

Report On Unrestricted Site Closure - Parcel D Shallow and Deep Soils

Former C-6 Facility
Los Angeles, California

Page 3
28 May 2004

The SAP proposed the installation of eight soil borings (Borings B1 through B8) to depths up to approximately 25 feet bgs. Soil samples were proposed to be collected at depths of 0.5, 5, 10, 15, and 25 feet bgs, and be analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), total petroleum hydrocarbons (TPH), metals, polychlorinated biphenyls (PCBs) and/or pesticides.

A Site investigation was conducted in June 1999 to characterize soil conditions in accordance with the LARWQCB-approved SAP. Based on the data collected during the Site investigation, arsenic was detected above the Site-specific health based remediation goal (HBRG) of 14 milligrams per kilogram (mg/kg) in soil Boring B3 at 0.5 feet bgs. The development of the HBRGs is described in the document titled *Health-Based Remediation Goals for Surface Soils* (Integrated 1997).

The elevated arsenic concentration at Boring B3 was further delineated using a 25-foot grid to the north, east, south, and west of Boring B3. Soil samples were collected at depths of 0.5, 1, and 2 feet bgs. Arsenic concentrations were reported to range from 3.2 to 840 mg/kg to depths up to 2.5 feet bgs (Integrated 1999b).

2.2.2 Arsenic Excavation, July/August 1999

A *Parcel D Excavation Plan* (Excavation Plan) dated July 1996 was submitted to and approved by the LARWQCB (Integrated 1996b) prior to excavation of soil exceeding the HBRG for arsenic on Parcel D. The purpose of the Excavation Plan was to describe the implementation procedures for the following activities:

- Excavate soils with arsenic concentrations above the HBRG of 14 mg/kg.
- Perform confirmation sampling.
- Backfill excavated areas with clean soil.
- Dispose excavated soil at an off-Site disposal facility.

Based on the elevated arsenic concentration in Boring B3 at 0.5 feet bgs (18 mg/kg), excavation activities were conducted. In July and August 1999, arsenic-impacted soil was excavated from an area measuring approximately 400 feet by 300 feet, extending to depths between 1.5 to 2.5 feet bgs (Integrated 1999c). Confirmation soil samples were collected and additional soil was excavated until the arsenic concentrations in the confirmation samples were less than 14 mg/kg. The approximate limits of the excavation are shown on Figure 3.

Approximately 8,200 cubic yards of non-hazardous soil were transported to the Bradley Landfill, and 42 cubic yards of non-Resource Conservation and Recovery Act (RCRA) hazardous waste were transported to Kettleman Landfill (Integrated 1999c), as documented in the *Parcel D Waste Discharge Requirement Monitoring and Reporting* document (Integrated 1999d). Based on the arsenic concentrations in the final confirmation soil samples (arsenic was not detected above 14 mg/kg at the limits of the excavation), no further excavation activities were conducted.

Former C-6 Facility
Los Angeles, California

Page 4
28 May 2004

A *Site Investigation and Excavation Report* was prepared by Integrated (Integrated 1999c) and summarizes the investigation activities conducted in accordance with the SAP and Excavation Plan in June and July 1999.

2.2.3 Investigation of Arsenic in Groundwater Beneath Parcel D, October 2000

In a letter from the LARWQCB dated 25 February 2000 (LARWQCB 2000), the LARWQCB concurred with the completion of the arsenic-impacted shallow soil remediation activities documented in the October 1999 Integrated report (Integrated 1999c). However, the LARWQCB requested monitoring for potential arsenic impacts to groundwater beneath Parcel D. In response to this letter, a groundwater sample was obtained on 12 October 2000 from a groundwater monitoring well (XMW-09) situated on Parcel D (BRC 2000). BRC transmitted the arsenic results from the groundwater sample to the LARWQCB in a letter dated 28 November 2000. The reported arsenic concentration for the groundwater sample collected from XMW-09 was less than the laboratory detection limit of 0.010 milligrams per liter (mg/L). After review of the arsenic data, the LARWQCB indicated in a letter dated 14 March 2001 that no additional soil or groundwater investigation was required on Parcel D with respect to arsenic.

2.2.4 Parcel D, Shallow Soil Closure, January 2001

On 5 January 2001, the LARWQCB issued a "no further action is required" determination for the shallow soils at Parcel D and concurred that Parcel D could be redeveloped for commercial/industrial purposes. The LARWQCB letter further indicated that they will review the existing data and determine if any additional investigation, remediation, or monitoring is required for the deeper soils (below 12 feet bgs to the underlying groundwater).

2.2.5 Additional Deep Soil Investigation of VOC Impacts - 2001

Pursuant to a meeting in January 2001, the LARWQCB requested one additional soil boring (Boring D-1) be advanced adjacent to the former Boring B7 (Figure 3) to delineate chloroform concentrations in deep soil beneath Parcel D. Chloroform was detected in Boring B7 at the following concentrations:

- 0.0035 mg/kg at 0.5 feet bgs;
- 0.010 mg/kg at 5 feet bgs;
- 0.130 mg/kg at 10 feet bgs;
- 0.260 mg/kg at 15 feet bgs; and
- 0.330 mg/kg at 25 feet bgs.

These data are included in Table A-2, Appendix A.

On 29 January 2001, Kennedy Jenks Consultants (KJC) drilled Boring D1 immediately adjacent to the former Boring B7 location using a truck-mounted hollow-stem auger drill rig. Soil samples were collected at depths of approximately 35, 45,

Report On Unrestricted Site Closure - Parcel D Shallow and Deep Soils

Former C-6 Facility
Los Angeles, California

Page 5
28 May 2004

and 55 feet bgs. Each sample was analyzed for VOCs using EPA Method 8260B. Laboratory results indicate that chloroform and methylene chloride were detected at concentrations slightly above the laboratory detection limits as follows:

- D-1-35 was collected at 35 feet bgs and had the following results:
 - Chloroform concentration of 0.0039 J mg/kg.
 - Methylene chloride concentration and 0.0065 mg/kg.
- D-1-45 was collected at 45 feet bgs and had the following results:
 - Chloroform concentration of 0.016 mg/kg.
 - Methylene chloride concentration of 0.0058 mg/kg.
- D-1-55 was collected at 55 feet bgs and had the following results:
 - Chloroform concentration of 0.012 mg/kg.
 - Methylene chloride concentration of 0.005 mg/kg.

The maximum concentration of chloroform detected in Boring D-1 was 0.016 mg/kg at 45 feet bgs. Boring D-1 shows that there are decreasing concentrations of chloroform with depth. Since methylene chloride had not been detected in soil samples during the June/July 1999 investigation, its detection in Boring D1 at trace levels is not considered to be of concern. Methylene chloride and chloroform are constituents that have been detected at elevated concentrations in soil and groundwater at the adjacent Former Montrose Chemical site.

2.2.6 Parcel D, Deep Soil Closure, September 2003

Based on the results of Boring D-1, a deep soil closure report was prepared and submitted to the LARWQCB on 15 October 2001 requesting closure using non-residential PRGs (Haley & Aldrich 2001). On 19 September 2003, the LARWQCB issued a "no further action is required" determination for the deep soils at Parcel D and concurred that Parcel D could be redeveloped for commercial/industrial purposes.

Former C-6 Facility
Los Angeles, California

Page 6
28 May 2004

3. COMPARISON OF CAL-ADJUSTED RESIDENTIAL PRGS

3.1 Cal-Adjusted Residential PRG Calculations

To evaluate if the residual soil concentrations in Parcel D are protective of human health for unrestricted use, they were compared to residential PRGs adjusted for California toxicity values (Cal-adjusted PRGs). The chemical concentrations detected in the upper 12 feet of soil at Parcel D were then compared to the Cal-adjusted residential PRGs, as summarized in Table I; and the chemical concentrations detected in the soil deeper than 12 feet bgs were compared to the Cal-adjusted residential PRGs as summarized in Table II. With the exception of the Cal-adjusted residential PRG for lead, the Cal-adjusted residential PRGs were developed from the EPA Region 9 residential PRGs (EPA 2002). Derivation of the Cal-adjusted residential PRGs was performed under the review and guidance of the Office of Environmental Health Hazard Assessment (OEHHA), which included:

- Adjusting the EPA Region 9 residential PRGs by substituting the California toxicity values (OEHHA 2003, 2004; ARB 2003) where available in place of the EPA approved toxicity values, and
- Including exposure associated with dermal contact for chemicals for which the soil ingestion pathway had been included in the EPA Region 9 residential PRGs.

Oral toxicity values were used to quantify the risk contribution in the Cal-adjusted residential PRGs for the dermal pathway.

The Cal-adjusted residential PRG for lead was derived using Version 7 of the DTSC Lead Risk Assessment Spreadsheet (LeadSpread) Model (DTSC 2000) and default assumptions for the child resident. While the LeadSpread Model calculates estimated 90th, 95th, 98th and 99th percentile blood lead concentrations, the DTSC identifies the 99th percentile blood lead as a "point of departure" (e.g., remedial actions would never be implemented when predicted blood lead levels are at or below 10 µg/dL). The child resident threshold concentration identified in the LeadSpread model using the DTSC default assumptions and the 99th percentile blood lead level is 146 mg/kg. This value was herein used as the Cal-adjusted residential PRG for lead. Appendix B includes the derivation of the Cal-adjusted residential PRGs.

3.2 Parcel D Shallow Soil Cal-Adjusted PRG Comparison

To evaluate if residual concentrations in shallow soil posed a human-health risk under an unrestricted, residential scenario, they were compared to the Cal-adjusted residential PRGs. Shallow soil boring locations are shown on Figure 3; Appendix A includes a summary of the analytical data. For the comparison, a table of maximum values of compounds detected was created (Table I) and compared to the Cal-adjusted PRGs. A review of Table I indicates that only one compound, tetrachloroethene (PCE), was detected in one soil sample above the Cal-adjusted residential PRG of 100 µg/kg. This soil sample, Par D-B6-1-0.5, was collected from Boring ParD-B6 at a depth of 0.5 feet bgs, and had a PCE concentration of 120 µg/kg. PCE concentrations at deeper depths of 5 and 10 feet bgs in this boring had concentrations of 16 µg/kg and less than 2.5 µg/kg, respectively, both less than the Cal-adjusted residential PRG.

Report On Unrestricted Site Closure - Parcel D Shallow and Deep Soils

Former C-6 Facility
Los Angeles, California

Page 7
28 May 2004

The presence of PCE at Parcel D at concentrations greater than the Cal-adjusted residential PRG is limited. In addition, Parcel D has since been redeveloped and grading activities have occurred. These grading activities have disturbed the upper two or more feet of surface soil and the former sample location. Due to volatilization of PCE that would occur during grading, it is unlikely that PCE concentrations greater than the Cal-adjusted residential PRG remain in shallow soil on Parcel D.

3.3 Parcel D Deep Soil Cal-Adjusted PRG Comparison

To evaluate if residual concentrations in deep soil posed a human-health risk under an unrestricted, residential scenario, they were compared to the Cal-adjusted residential PRGs. Deep soil boring locations are shown on Figure 3; Appendix A includes a summary of the analytical data. For the comparison, a table of maximum values of compounds detected was created (Table II) and compared to the Cal-adjusted PRGs. A review of Table II indicates that no compounds were detected above the Cal-adjusted residential PRGs.

Report On Unrestricted Site Closure - Parcel D Shallow and Deep Soils

Former C-6 Facility
Los Angeles, California

Page 8
28 May 2004

4. SUMMARY, CONCLUSION, AND REQUEST

Potential source areas at Parcel D were identified and the shallow and deep soils were assessed. In 1999, eight soil borings (Borings B1 through B8) were advanced to depths up to 25 feet bgs to investigate the potential source areas. Soil samples were collected and analyzed for VOCs, SVOCs, TPH, metals, PCBs and/or pesticides. Based on the analytical results, one elevated arsenic concentration (18 mg/kg) was detected in Boring B3 at 0.5 feet bgs. This arsenic concentration was delineated. Arsenic-impacted soil was excavated from an area approximately 400 feet by 300 feet and extending to depths between 1.5 and 2.5 feet bgs. Confirmation soil samples were collected and additional soil was excavated until the arsenic concentrations in the confirmation samples were less than 14 mg/kg. Approximately 8,200 cubic yards of soil were excavated and transported off-Site.

Parcel D shallow and deep soil closure was granted by the LARWQCB for commercial/industrial use in 2001 and 2003, respectively. To evaluate if the residual soil concentrations in Parcel D are protective of human health for unrestricted use, they were compared to residential PRGs adjusted for California toxicity values (Cal-adjusted PRGs) which were derived under the review and guidance of OEHHA and the LARWQCB. The Cal-adjusted PRG for lead was derived using the DTSC LeadSpread model to be protective for a child resident.

Based on the comparison of shallow and deep soils to the Cal-adjusted residential PRGs, only one occurrence of a chemical concentration (PCE) above the Cal-adjusted residential PRG was detected in shallow soils (0.5 feet bgs). However, due to volatilization of PCE that would occur during grading, it is unlikely that PCE concentrations greater than the Cal-adjusted residential PRG remain in shallow soil on Parcel D. No compounds were detected above the Cal-adjusted residential PRGs in deep soils.

Based on this comparison, a "no further action" letter for unrestricted closure of shallow and deep soil impacts at Parcel D is being requested from the LARWQCB.

5. LIMITATIONS

This report was prepared by Haley & Aldrich, Inc., under the professional direction and review of the registered professionals listed on the cover page. The work described herein was conducted in accordance with generally accepted professional engineering and geologic practice. No other warranty exists, either expressed or implied.

This report incorporates Site conditions observed and described by others as reported in records available to Haley & Aldrich as of the date of report preparation. Haley & Aldrich relied—in part—on such data collected by others in the development of interpretations about environmental conditions at the Site. The accuracy, precision, or representative nature of data originally generated by others could not be independently verified by Haley & Aldrich and would be beyond the scope of this project.

In addition, the passage of time may result in changes in site conditions, technology, or economic conditions which could alter the findings and/or recommendations of the report.

Table II
Deep Soil Comparison
Former C-6 Facility, Parcel D
Los Angeles, California

Page 1 of 1

Analyte	Maximum Concentration Detected	Units	Cal-Adjusted PRG	Units
4,4'-DDT	3.5	ug/kg	1,700	ug/kg
Arsenic	12	mg/kg	14	mg/kg
Barium	190	mg/kg	4,000	mg/kg
Beryllium	0.89	mg/kg	1,100	mg/kg
Cadmium	0.61	mg/kg	1.7	mg/kg
Chloroform	330	ug/kg	890	ug/kg
Chromium Total	33	mg/kg	120,000	mg/kg
Cobalt	14	mg/kg	900	mg/kg
Copper	38	mg/kg	3,100	mg/kg
Lead	7.9	mg/kg	146	mg/kg
Molybdenum	1.3	mg/kg	390	mg/kg
Nickel	23	mg/kg	4,000	mg/kg
Phenol	1,500	ug/kg	37,000,000	ug/kg
Tetrachloroethene	14	ug/kg	100	ug/kg
Vanadium	68	mg/kg	550	mg/kg
Zinc	86	mg/kg	23,000	mg/kg

Notes:

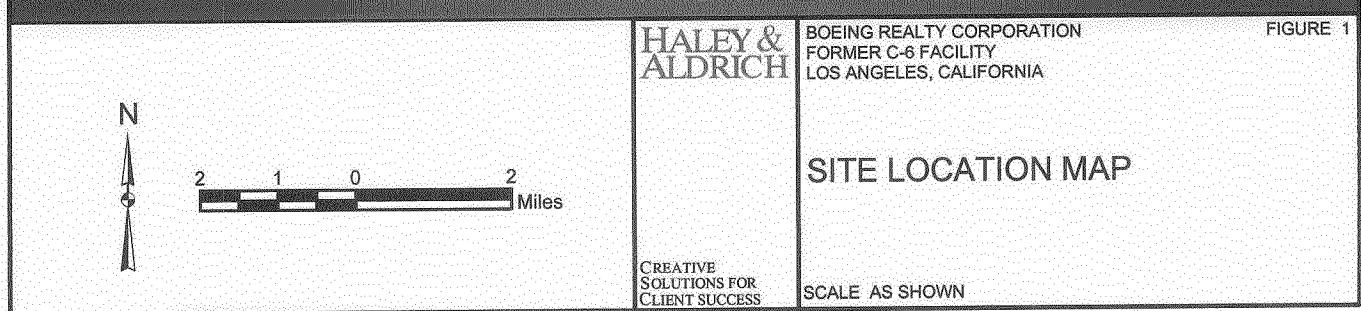

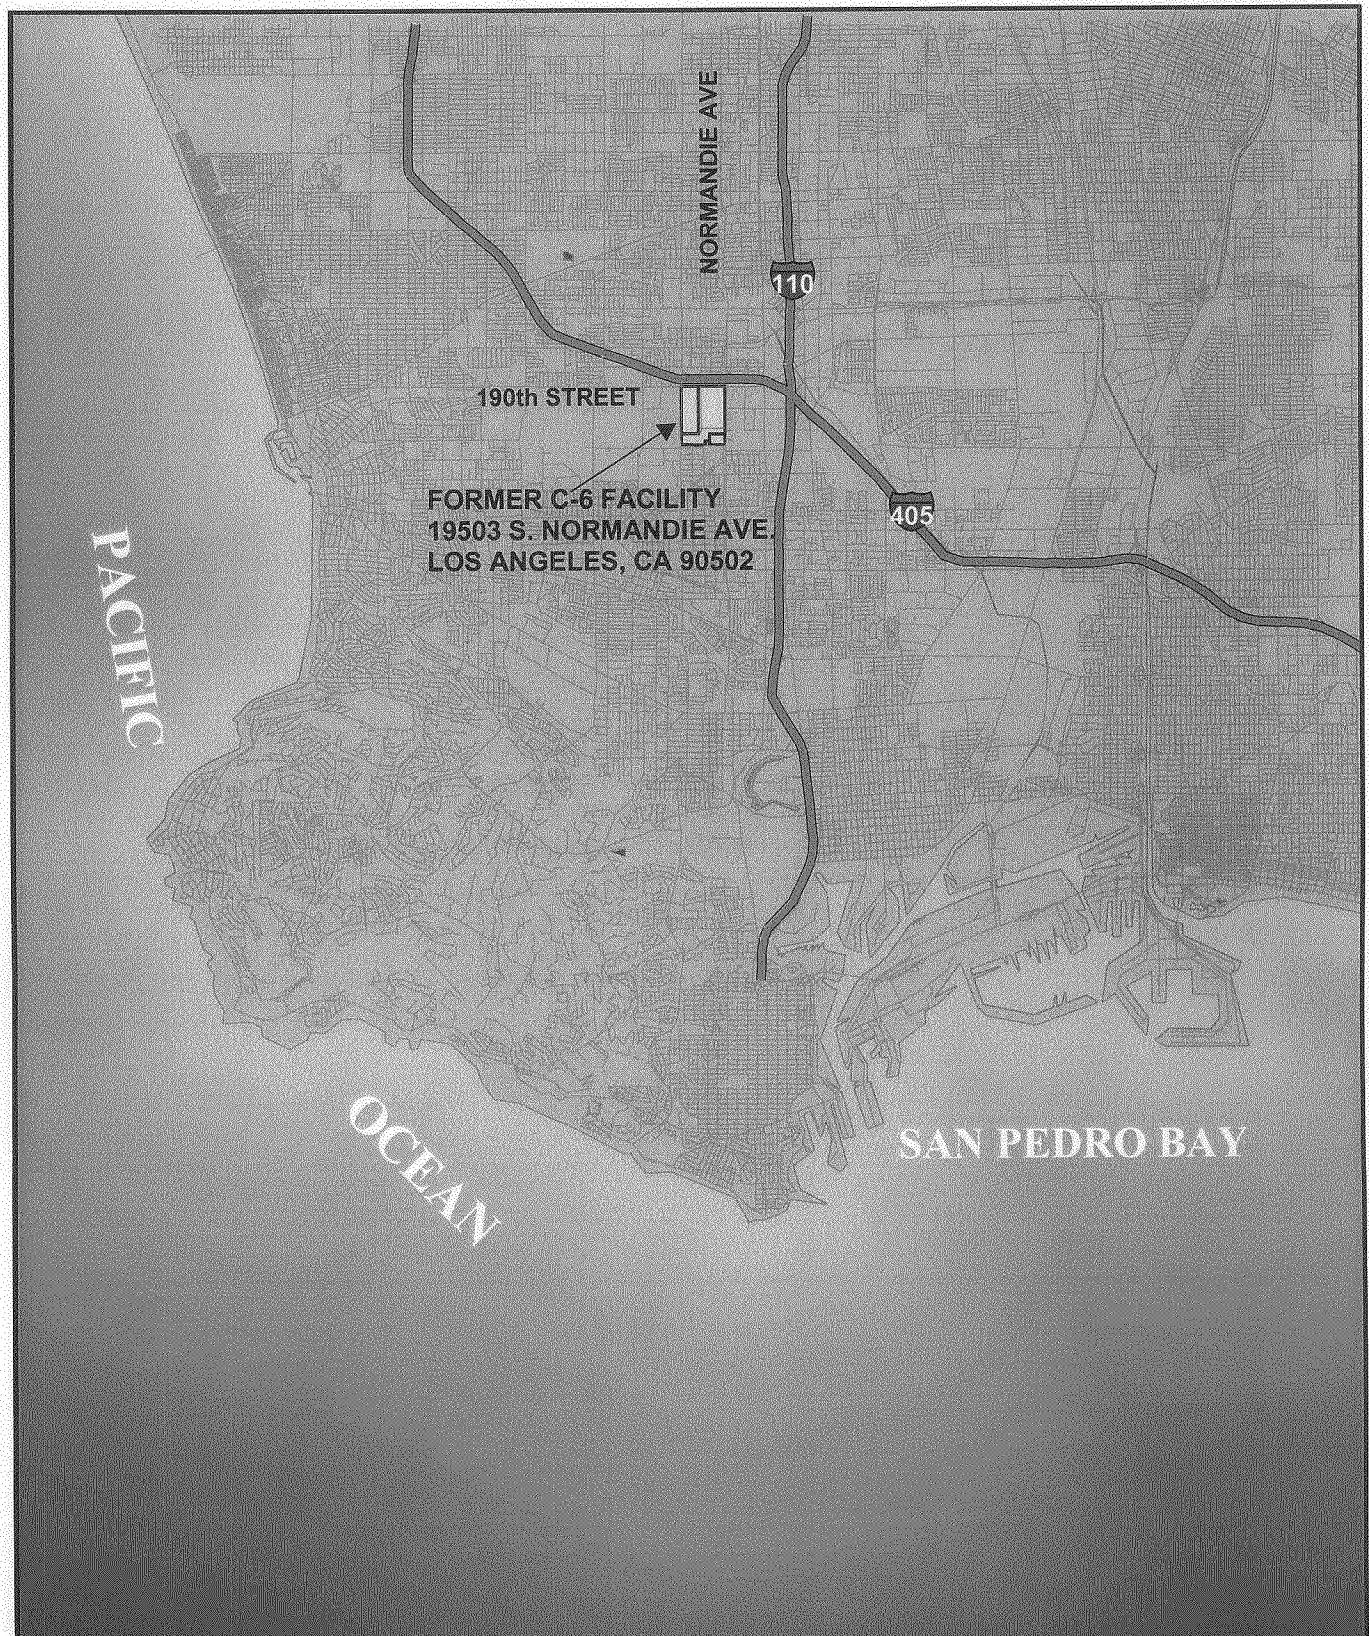

ug/kg = micrograms per kilogram

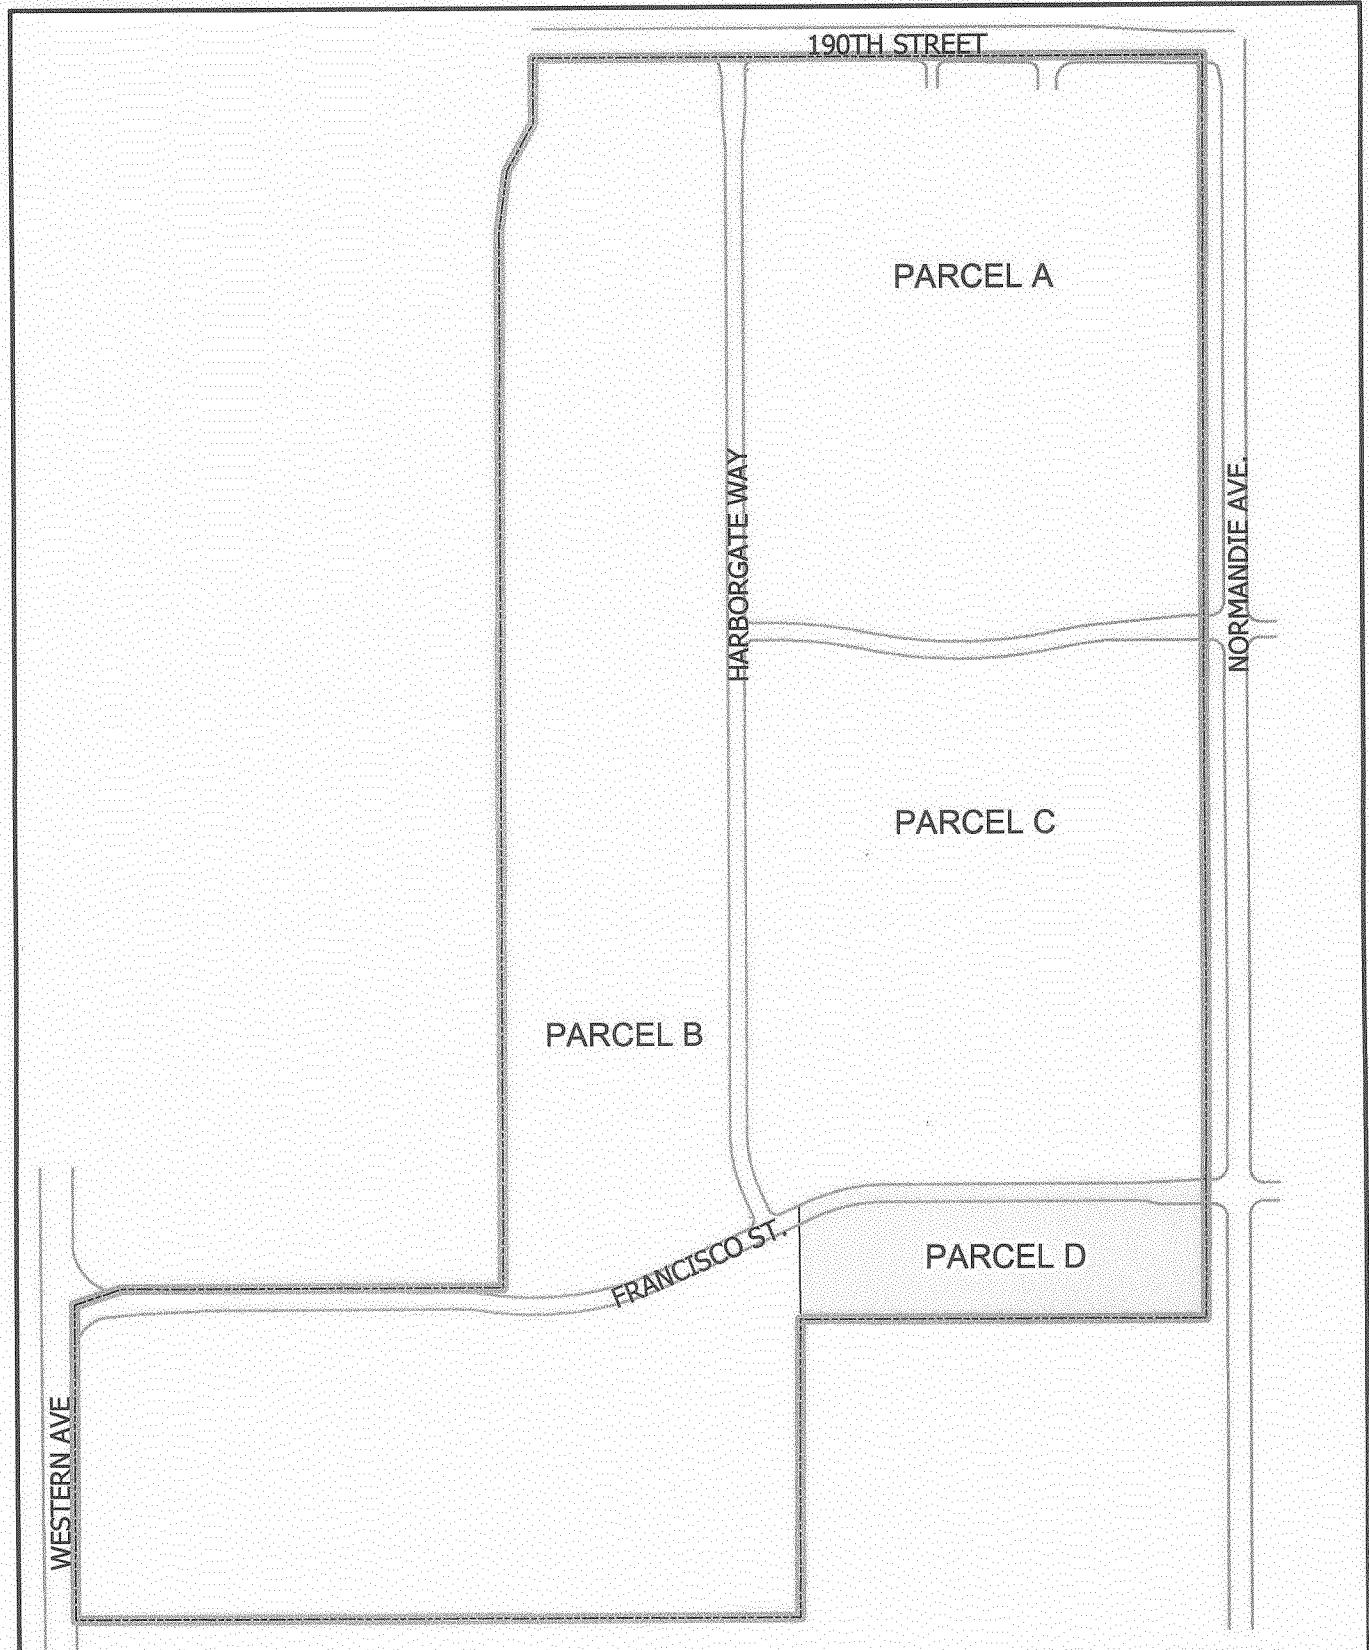

mg/kg = milligrams per kilogram

QA/QC: B8

TABLE B-2
DERIVATION OF CALIFORNIA-ADJUSTED PRELIMINARY REMEDIATION GOALS (PRGS) - CANCER

Italics = Either toxicity values or physical parameter information is not readily available, or IARC cancer group is 3 and/or USEPA cancer group is C or D (i.e., insufficient toxicological data for assessment of cancer in humans).

nc = not classified

Carcinogenic Classifications:

IARC

- Group 1: Carcinogenic to humans (sufficient evidence of carcinogenicity in humans)
- Group 2A: Probably carcinogenic to humans (limited evidence of carcinogenicity in humans and sufficient evidence of carcinogenicity in experimental animals)
- Group 2B: Possibly carcinogenic to humans (limited evidence in humans in the absence of sufficient evidence in experimental animals, or inadequate evidence of carcinogenicity in humans or when human data are nonexistent but there is sufficient evidence of carcinogenicity in experimental animals)
- Group 3: Not classifiable as to its carcinogenicity to humans
- Group 4: Probably not carcinogenic to humans (evidence suggesting lack of carcinogenicity in humans together with evidence suggesting lack of carcinogenicity in experimental animals)

USEPA

- Group A: Human carcinogen
- Group B1: Probable human carcinogen (limited evidence of human carcinogenicity based on epidemiologic studies and sufficient evidence of carcinogenicity based on animal studies)
- Group B2: Probable human carcinogen (inadequate or no data for human carcinogenicity and sufficient evidence from animal studies)
- Group C: Possible human carcinogen (limited evidence of carcinogenicity in animals in the absence of human data)
- Group D: Not classifiable as to human carcinogenicity (inadequate human and animal evidence of carcinogenicity or no data are available)
- Group E: Evidence of noncarcinogenicity for humans
